

BIG CHALK BOX

Investor Business Plan

Building the assessment operating system for handwritten education

Prepared 31 July 2026 • India • Confidential

400+ sheets evaluated	20+ educators onboard	98% rubric accuracy	~15 sec processing / sheet
---------------------------------	---------------------------------	-------------------------------	--------------------------------------

INVESTMENT PROPOSITION

Own the full assessment lifecycle, not one grading feature.

Question Paper Generation and Moderation provide a low-friction entry point. DASES expands the account into recurring, high-value handwritten evaluation, faculty review, student feedback, and institutional analytics.

Company-reported product metrics; validation plan included in this document.

SECTION 01

Executive Summary

A focused investment case for an early-stage academic infrastructure company

RECOMMENDED SEED PROPOSAL

₹4.0 crore for approximately 18 months of runway

Use the round to reach 50 paying institutions, a ₹2.0 crore ARR run-rate, 70%+ gross-margin trajectory, independently documented accuracy, and enterprise-grade privacy/security readiness. The amount and milestones are management recommendations, not current commitments.

Big Chalk Box Pvt. Ltd., founded in 2024, is building AI infrastructure for the most operationally heavy part of education: designing, moderating, evaluating, and learning from handwritten assessments. Its flagship product, DASES (Digital Academic Student Evaluation System), reads handwritten scripts, scores each answer against faculty-defined rubrics, and generates detailed per-question feedback for faculty review.

The core investment thesis is stronger than a single AI-grading feature. Big Chalk Box can become an assessment workflow system that begins before the exam and compounds after it: syllabus-aligned paper generation, quality moderation, sample answers, marking rubrics, script evaluation, human approval, student feedback, and performance analytics in one institutional record.

Why now. India registered 64,756 higher-education institutions and nearly 4.5 crore students in AISHE 2023-24. A 2025 FICCI-EY-Parthenon survey reported that 38% of participating Indian HEIs cited automated grading as an AI application, while also emphasizing phased pilots, governance, fairness, and data protection. The market is large, but trust and workflow integration—not generic model access—will determine adoption. [5][6]

The investor case

- Clear pain with budget value: grading consumes faculty time, result cycles are slow, and feedback is inconsistent or thin.
- A wedge-and-expand model: ₹400 + GST per question paper lowers adoption friction; DASES evaluation creates larger, recurring institutional contracts.
- Early technical proof: the company reports 400+ sheets evaluated, 20+ educators onboard, 98% rubric accuracy, ~15 seconds per sheet, and 500-sheet parallel capacity. [1][2]
- A credible India-first position: handwritten descriptive formats, internal-choice structures, syllabus mapping, Bloom's taxonomy, and price sensitivity are central—not edge cases.

- A defensibility path: workflow data, approved rubrics, faculty overrides, integrations, audit trails, and trust can become harder to replace than the underlying AI models.

What must be proven in the next 18 months

Proof point	18-month target	Investor significance
Commercial	50 paying institutions; ₹2.0 crore ARR run-rate	Demonstrates repeatable conversion beyond founder-led pilots
Retention	>90% gross logo retention; multi-module expansion	Shows workflow stickiness and cross-sell
Economics	70%+ gross-margin trajectory; CAC payback <12 months	Supports venture-scale operating leverage
Trust	Independent benchmark + human-review policy	De-risks grading accuracy and institutional adoption
Governance	DPDP-ready controls, audit logs, retention/deletion workflows	Reduces enterprise and regulatory friction

SECTION 02

Company, Mission & Problem

Educators should spend time on teaching and judgment—not repetitive paper operations

Big Chalk Box describes itself as an India-based EdTech engineering company built by engineers and educators. The company's public mission is to automate the tedious, high-effort parts of academic work while keeping educators in control. DASES is the current flagship; Question Paper Generation and Moderation extend the company into a full academic assessment suite. [2][3]

The operational problem

Stage	Current institutional friction	Business consequence
Paper design	Questions are assembled manually across syllabi, outcomes, difficulty levels, and prior papers	Slow cycles; uneven quality; repeated questions
Moderation	Review depends on scarce senior faculty and inconsistent checklists	Ambiguity, syllabus gaps, appeals, and rework
Rubric creation	Model answers and criteria are often late, coarse, or inconsistent	Evaluator drift and weak partial-credit logic
Evaluation	Hundreds of handwritten scripts are reviewed sequentially	Delayed results and faculty workload spikes
Feedback	Time pressure reduces feedback to a score or short remark	Students do not know how to improve
Analytics	Question-level evidence is trapped in paper files	Little insight into topic gaps or assessment quality

Why existing approaches leave a gap

- Manual grading preserves judgment but does not scale consistently across large batches.
- On-screen marking digitizes handling, but many workflows still require human scoring for every response.
- Global grading tools digitize handwritten submissions and may group similar answers, but are not necessarily designed for autonomous rubric-based evaluation of Indian descriptive exam formats. [7]
- Generic AI tools can draft questions or score text, but lack institutional controls, original-script traceability, audit trails, and an end-to-end academic workflow.

DESIGN PRINCIPLE

AI proposes and processes; faculty remain accountable.

The defensible operating model is human-in-the-loop: faculty approve rubrics, review low-confidence or high-stakes answers, override scores, and publish results. This positions Big Chalk Box as decision-support infrastructure rather than an unreviewable black-box grader.

SECTION 03

Product Suite & Workflow

One assessment record from syllabus to student feedback

The suite is organized around a single lifecycle. Each module can sell independently, but the strategic value comes from shared syllabus, question, answer, rubric, and evaluation data flowing forward without re-entry.

Figure 1. Target assessment lifecycle. Current module status and roadmap should be confirmed before external circulation.

Module	Customer job	Current value proposition
Question Paper Moderation	Audit a draft before approval	Syllabus coverage, difficulty/Bloom's balance, ambiguity, duplication, structure, and suggested revisions
Question Paper Generation	Create a compliant paper quickly	Syllabus-aligned generation by section, difficulty, Bloom's targets, sample answers, rubrics, and print-ready output

Module	Customer job	Current value proposition
DASES Evaluation	Evaluate handwritten scripts at scale	Handwriting recognition, rubric-based scoring, per-question feedback, faculty review, and student reports
Analytics layer	Improve teaching and assessment quality	Coverage, question performance, criterion gaps, and—in later releases—outcome attainment

Product edge that matters to institutions

- Institution-specific configuration: syllabi, course outcomes, formats, internal choices, mark allocations, and rubric rules.
- Original-to-decision traceability: faculty should be able to inspect the scan, extracted content, criterion score, rationale, override, and approver.
- Pre-exam and post-exam continuity: the same approved question paper, sample answer, and rubric flow into evaluation.
- Operational scale: company-reported processing of up to 500 sheets in parallel at approximately 15 seconds per sheet. [1][3]
- Feedback as a product: every student can receive question-level, criterion-level guidance—not merely a total score.

September 2026 release commitment

The supplied pricing roadmap states that Sample Answers and Marking Rubrics for Question Paper Moderation are scheduled for release in September 2026. This release is strategically important because it closes the handoff from paper quality to DASES evaluation and increases cross-module attach rate.

SECTION 04

Business Model & Pricing

Preserve the low-friction entry point; convert usage into committed institutional revenue

Offering	Public price	Commercial role
Question Paper Moderation	₹400 + GST / paper	Low-risk paid wedge; creates evidence and an evaluation-ready rubric
Question Paper Generation	₹400 + GST / paper	Faculty productivity wedge; generates sample answers and marking rubrics
DASES Evaluation	Custom pricing	Primary expansion product; price by volume, modules, support, and integration needs

Source: management-supplied Pricing — BigChalkBox Academic Suite, July 2026. GST is excluded from revenue calculations.

Recommended packaging architecture

Commercial layer	Illustrative structure	Purpose
Pay-as-you-go	Retain ₹400/paper for generation and moderation	Fast departmental adoption; transparent value demonstration
Department commitment	₹2.4–4.8 lakh annual minimum; shared credits + evaluation volume	Creates recurring revenue and predictable usage
Institution contract	₹8–20 lakh annual minimum; multi-department controls, integrations, SLA, analytics	Raises ACV and embeds the platform institution-wide
Overages / services	Per-sheet evaluation overage; implementation/integration fees	Protects gross margin and funds non-standard work

Illustrative management recommendation—not current published pricing. Final tiers require unit-cost, willingness-to-pay, and procurement testing.

Economic logic

1. Land: one department buys generation or moderation for a small number of papers.
2. Prove: a structured pilot measures faculty hours, agreement with approved scores, review time, and student feedback quality.
3. Expand: evaluation volume, additional departments, student reports, analytics, and integrations increase annual contract value.
4. Renew: reusable syllabi, rubrics, workflows, permissions, and reporting history reduce the cost of each subsequent exam cycle.

PILOT ROI INSTRUMENT

Measure value before negotiating a campus-wide contract.

For every pilot, record baseline faculty hours, AI processing time, faculty review time, score agreement, override rate, result turnaround, feedback coverage, compute cost, and willingness to renew. The investor-quality metric is not 'sheets processed'; it is repeatable paid conversion with improving gross margin.

SECTION 05

Traction & Evidence

Promising product proof; the next round must convert it into commercial proof

Metric	Reported result	Diligence standard for next round
Sheets evaluated	400+	Batch-level log with subjects, institutions, dates, and review outcomes
Educators onboard	20+	Active vs. trial users; institution count; 30/90-day retention
Rubric accuracy	98%	Predefined benchmark, sample size, blind human comparison, confidence interval

Metric	Reported result	Diligence standard for next round
Processing time	~15 sec/sheet	p50/p95 latency by page count, subject, image quality, and batch size
Parallel scale	Up to 500 sheets	Load test, failure/retry rate, queue behavior, and cost per sheet
Program support	Runway Incubator; Google for Startups; AWS Startups listed	Acceptance/credit documentation and active benefit status

All results in this table are company-reported on DASES public pages and should be substantiated in the investor data room. [1][2]

Evidence hierarchy investors will reward

- Best: paid renewals and expansion across departments.
- Strong: signed annual contracts, purchase orders, or paid pilots with referenceable institutions.
- Useful: dated LOIs with scope, expected contract value, and procurement owner.
- Supporting: educator usage, testimonial, benchmark, or demo engagement.
- Weak alone: waitlist size, page views, unqualified signups, or unverified accuracy claims.

MESSAGING DISCIPLINE

Convert technical claims into auditable institutional outcomes.

Use 'company-reported' until an independent or jointly signed validation exists. Replace broad claims such as 'human-level accuracy' with benchmark definitions, exceptions, and the faculty review policy. Credibility improves the deal more than an inflated metric.

SECTION 06

Market Opportunity

A large institutional base with a narrow, measurable beachhead

AISHE 2023-24 registered 1,289 universities, 48,246 colleges, and 15,221 standalone institutions—64,756 HEIs in total—with nearly 4.5 crore students and 17.3 lakh teachers. Seventy percent of responding colleges were private unaided, an attractive segment for faster procurement and measurable operating ROI. [5]

Layer	Scope assumption	Illustrative ACV	Annual value
TAM	64,756 registered Indian HEIs	₹6 lakh	₹3,885 crore
SAM	20,000 priority private/autonomous/technical institutions	₹6 lakh	₹1,200 crore
4-year SOM	450 contracted institutions	₹8 lakh	₹36 crore ACV

Bottom-up management sizing, not a third-party market forecast. TAM/SAM use an illustrative blended annual contract value; SOM is an execution target. Recognized FY30 revenue is lower than exit ACV because customers ramp through the year.

Beachhead customer profile

- Private and autonomous universities or colleges with 1,000–10,000 students.
- Engineering, management, science, and professional programs with frequent descriptive assessments.
- A Controller of Examinations, Dean, HOD, or quality/accreditation owner with a visible result-turnaround problem.
- Existing scanning capability or willingness to adopt a standardized scan workflow.
- A department prepared to run a faculty-reviewed pilot on 100–500 scripts.

Timing signal

The 2025 FICCI-EY-Parthenon survey of 30 Indian HEIs found that 57% had an institutional AI policy and another 40% were developing one; 38% cited automated grading among academic applications. The same research calls for phased adoption and highlights fairness, transparency, accountability, and data protection. That combination favors a pilot-first vendor with strong governance rather than a generic AI tool. [6]

SECTION 07

Go-to-Market Strategy

A reference-led institutional motion with productized pilots

Stage	Offer	Decision owner	Target evidence
1. Diagnose	Exam workflow assessment + live demo	HOD / Dean / COE	Qualified pain, volume, budget, timeline
2. Pilot	1 department; 1 paper; 100–500 scripts	Faculty champion + evaluator	Accuracy, review time, turnaround, ROI
3. Convert	Annual department commitment	Dean / procurement	Paid contract and recurring calendar
4. Expand	More departments + modules + integrations	COE / CIO / academic leadership	Higher ACV and multi-threaded use
5. Reference	Case study + peer introduction	Institution sponsor	Lower CAC and regional trust

Channel priorities

- Founder-led direct sales for the first 25–30 institutions to refine the playbook.
- Regional academic networks, incubators, and educator champions for references.
- Scanner/document-digitization partners that already serve exam cells.

- ERP/LMS and accreditation consultants as implementation and referral partners.
- Selective coaching-institute and school pilots only where the same workflow and unit economics apply.

Operating funnel targets

KPI	Initial target	Why it matters
Qualified demo → pilot	>35%	Indicates the pain and product promise are real
Pilot → paid annual	>40%	Tests willingness to pay and procurement readiness
Time to first evaluated batch	<14 days	Reduces implementation friction
Gross logo retention	>90%	Validates recurring exam-cycle value
Net revenue retention	>115%	Shows module and department expansion
CAC payback	<12 months	Keeps institutional sales capital-efficient
Receivable days	<75 days	Prevents procurement cycles from consuming runway

Targets are management assumptions for operating discipline; they are not historical performance.

SECTION 08

Competitive Landscape & Defensibility

The moat must be workflow trust and distribution—not access to an AI model

Alternative	What it does well	Gap / strategic response
Gradescope / Turnitin	Digitizes paper assessments, supports handwritten work, dynamic rubrics, AI-assisted answer grouping, analytics, LMS workflows	Differentiate on India-specific descriptive automation, pre-exam generation/moderation, local formats, and institutional economics. [7]
Eklavya	Broad exam platform with question generation, handwritten AI evaluation, multilingual workflows, identity masking, and audit/re-evaluation capabilities	Closest direct competitor. Win on product coherence, measurable evaluation quality, faster pilots, transparent pricing wedge, and focused assessment lifecycle. [8]
On-screen marking vendors	Mature scan, allocation, blind marking, and audit workflows	Integrate where useful; lead with AI-assisted scoring and feedback economics
Generic AI / OCR	Low-cost drafting, OCR, and experimentation	Emphasize original-script traceability, permissions, review, rubrics, data controls, and repeatable institutional operations
Manual process	Trusted judgment and flexible exception handling	Retain faculty authority while automating repetitive work

Defensibility roadmap

- Workflow depth: one canonical assessment record from syllabus through approved student result.
- Institutional configuration: paper formats, outcomes, rubrics, policies, access controls, and escalation rules.

- Quality system: benchmark sets, confidence thresholds, faculty overrides, drift monitoring, and appeal outcomes.
- Integration surface: scanners, rosters, ERP/LMS gradebooks, identity, and institutional reporting.
- Distribution: reference institutions, evaluator champions, partners, and implementation know-how by segment.
- Privacy-preserving learning: improve prompts, workflows, and evaluation logic only under clear contractual data rights; do not assume student data can be reused for model training.

INVESTOR REALITY CHECK

Accuracy claims are necessary; reliable operations create the moat.

Vision and language models will continue improving and commoditizing. Durable value comes from evaluation governance, approved workflows, data rights, integrations, evidence, and trusted distribution inside institutions.

SECTION 09

Technology, Quality & Governance

Build for a challenged grade, not only a successful demo

Target evaluation control loop

5. Ingest: validate scan quality, identity mapping, page count, and file integrity.
6. Recognize: extract handwriting and preserve the original-image reference.
7. Map: link every response to the correct question, including internal choices and continuation pages.
8. Evaluate: score each rubric criterion, produce rationale, and record model/version/configuration.
9. Escalate: route low-confidence, anomalous, or high-stakes responses to faculty.
10. Approve: allow faculty override with reason codes; preserve the full audit trail.
11. Publish: generate institutional reports and apply retention/deletion rules.

Minimum enterprise control set

Control area	Required capability
Accuracy	Subject- and question-type benchmark; inter-rater protocol; override-rate tracking; confidence thresholds
Fairness	Blind review where appropriate; cohort error analysis; handwriting-quality and language-segment checks

Control area	Required capability
Auditability	Immutable event trail for upload, extraction, score, override, approver, and publication
Privacy	Data inventory, lawful basis/notice support, purpose limitation, retention schedule, deletion/export workflow, vendor DPAs
Security	Encryption, RBAC, least privilege, isolated tenants, secrets management, backups, incident response, vulnerability testing
Reliability	Retry logic, queue visibility, idempotency, model fallback policy, service-level monitoring, disaster recovery
Academic control	Faculty-approved rubrics, explicit appeal/re-evaluation process, no autonomous publication by default

India's Digital Personal Data Protection Rules, 2025 were notified in November 2025 with a staged enforcement timeline for the Act and Rules. Because answer sheets and student identifiers are personal data, privacy readiness should be part of the product roadmap and contract architecture, with qualified Indian legal counsel confirming obligations and timelines. [9]

NON-NEGOTIABLE POLICY

Faculty approval remains the final grading authority.

At this stage, DASES should default to assistive evaluation with visible rationale, editable scores, confidence-based escalation, and a documented re-evaluation route. This reduces both adoption risk and academic harm.

SECTION 10

18–36 Month Execution Roadmap

Fund milestones that change the next financing outcome

Period	Product & trust	Commercial	Organization
0–6 months	Ship Sept 2026 sample answers/rubrics; benchmark protocol; confidence routing; cost telemetry; core DPDP controls	10–15 paying institutions; 3 referenceable pilots; productized pilot kit	Strengthen AI/ML, academic QA, and customer success
6–12 months	Multi-department administration; audit/re-evaluation; ERP/LMS/roster connectors; usage billing	25–30 paying institutions; repeatable regional funnel; first expansion contracts	Hire enterprise sales and implementation leads
12–18 months	Independent validation; security audit/certification readiness; analytics v1	50 paying institutions; ₹2 crore ARR run-rate; >90% gross retention	Board reporting, finance controls, and second-line leadership
18–36 months	Language/subject expansion based on demand; accreditation analytics; partner APIs	200 institutions by FY29; selective school/coaching channels; 2–3 regional clusters	Scale GTM, support, security, and model operations

Hiring plan by capability

Capability	Near-term priority	Why now
AI/ML & evaluation quality	Senior owner + evaluation engineer	Benchmarking, confidence, cost, model reliability
Academic quality	Advisor panel + full-time program lead	Rubric design, subject coverage, faculty trust
Product/engineering	2–3 full-stack/platform hires	Admin, integrations, billing, reliability
Enterprise sales	2 focused sellers after playbook validation	Convert pilots without scaling founder dependency too early
Customer success	Implementation lead + support	Faster first value, stronger retention and references
Security/privacy	Fractional specialist → dedicated owner	Enterprise diligence and DPDP readiness

Team disclosure for investor circulation. Add the founders' names, roles, ownership, full-time status, prior technical/education experience, and one proof point per person to the accompanying pitch deck and data room. The public site currently describes the team only as engineers and educators based in India; investors will require named biographies. [2]

SECTION 11

Illustrative Financial Plan

A milestone model to test the business—not a substitute for actual historicals

MODEL STATUS

Base-case management assumptions; replace with actuals before circulation.

The model below is intentionally bottom-up and conservative on early revenue recognition. It assumes annual commitments grow as accounts add evaluation volume, departments, analytics, and integrations. It excludes GST and does not include financing proceeds as revenue.

Metric	FY27	FY28	FY29	FY30
Exit paying institutions	20	75	200	450
Average active institutions	10	45	135	325
Blended revenue / active institution	₹2.5L	₹4.0L	₹6.0L	₹8.0L
Revenue	₹0.25Cr	₹1.80Cr	₹8.10Cr	₹26.00Cr
Gross margin	58%	68%	76%	80%
Gross profit	₹0.15Cr	₹1.22Cr	₹6.16Cr	₹20.80Cr
Operating expenses	₹1.70Cr	₹3.40Cr	₹7.00Cr	₹14.00Cr
EBITDA	(₹1.55Cr)	(₹2.18Cr)	(₹0.84Cr)	₹6.80Cr

Model drivers to validate immediately

- DASES price realization per sheet, paper, department, and institution.
- Model/API, OCR, storage, report generation, and human QA cost per sheet.
- Pilot support hours and implementation cost by institution size.
- Procurement duration, discounting, payment schedule, and receivable days.
- Pilot conversion, renewal, module attach, and department expansion rates.
- Headcount plan, founder compensation, cloud credits, and tax/compliance costs.

FY27 means the financial year ending March 2027. Because this plan is dated July 2026, FY27 is a partial execution year. Forecasts should be re-cut using the latest monthly actuals and qualified pipeline.

SECTION 12

Funding Proposal & Use of Funds

A seed round sized to evidence, not vanity

PROPOSED RAISE

₹4.0 crore primary capital · approximately 18 months

The financing should be positioned as a milestone round to establish repeatable institutional sales, trusted evaluation quality, enterprise readiness, and a ₹2.0 crore ARR run-rate. Final valuation, instrument, and rights require current cap-table, revenue, pipeline, and qualified legal/tax advice.

Use	%	Amount	Expected output
Product, AI & engineering	35%	₹1.40Cr	Evaluation quality, workflow depth, reliability, billing, and integrations
Go-to-market	25%	₹1.00Cr	Productized pilots, regional pipeline, sales capacity, references
Security, privacy & QA	15%	₹0.60Cr	DPDP program, audit trail, benchmark, external testing/certification readiness

Use	%	Amount	Expected output
Cloud & data operations	12.5%	₹0.50Cr	Processing capacity, observability, backups, cost optimization
Customer success & implementation	7.5%	₹0.30Cr	Faster onboarding, training, support, institutional deployment
Legal, finance & contingency	5%	₹0.20Cr	Contracts, finance controls, IP/data documentation, buffer

Round milestones

By month	Milestone	Financing implication
6	10–15 paying institutions; September features live; benchmark protocol running	Confirms product completion and paid wedge
12	25–30 institutions; >₹1 crore ARR run-rate; 3 referenceable case studies	Supports repeatability and reference-led growth
18	50 institutions; ₹2 crore ARR run-rate; 70%+ GM trajectory; >90% gross retention	Creates a credible Series A / extension decision point

Investor fit

- Seed investor with B2B SaaS and India institutional-sales experience.
- Education, assessment, ERP/LMS, or public-sector networks that accelerate references and procurement.
- AI governance, data protection, and enterprise security operating support.
- Follow-on capacity for a later round if commercial evidence compounds.
- No commercial exclusivity that restricts the company from serving broad institutional segments.

SECTION 13

Key Risks & Mitigations

The plan becomes investable when risks are measurable and owned

Risk	Potential impact	Mitigation and leading indicator
Accuracy / grading harm	Loss of trust, disputes, academic harm	Faculty approval; confidence routing; benchmark by subject/question type; override and appeal tracking
Privacy / DPDP	Contract loss, remediation cost, regulatory exposure	Data inventory, notice/contract support, retention/deletion, DPAs, incident response, legal review
Long procurement cycles	Slow revenue and high working capital	Paid department pilots, procurement map, milestone billing, receivable target, channel partners
Model and compute costs	Weak gross margin at scale	Per-sheet telemetry, model routing, caching, batch processing, overage floors, quarterly price review
Competitive response	Price pressure and feature parity	Integrated workflow, evidence, references, India-specific formats, fast implementation, integrations

Risk	Potential impact	Mitigation and leading indicator
Unsubstantiated claims	Investor/customer credibility loss	Claim register, methodology appendix, independent validation, signed customer case studies
Seasonality	Revenue concentration around exam cycles	Annual commitments, multiple modules, multiple institution segments, implementation calendars
Founder / key-person risk	Sales and product bottleneck	Named owners, second-line hires, board cadence, documentation, delegated customer success

DECISION RULE**Do not scale autonomous scoring faster than the evidence system.**

Expansion should follow demonstrated agreement, explainability, review efficiency, and appeal outcomes by subject and answer type. When confidence is low, route to a person—the platform's credibility is more valuable than marginal automation.

SECTION 14**Investor Diligence Readiness**

The fastest route to a better deal is removing uncertainty before term-sheet discussion

Data-room folder	Minimum content before investor circulation
Corporate	Certificate of incorporation, constitutional documents, cap table, past issuances, board/shareholder approvals, statutory filings
Team	Named founder bios, employment/consulting agreements, ESOP plan, hiring plan, reference checks
Commercial	Revenue by customer/month/module, contracts, invoices, pipeline with stage/value/date, LOIs/POs, churn/renewal
Product & traction	Usage logs, institution/educator definitions, pilot reports, product roadmap, support metrics
Accuracy & QA	Benchmark methodology, dataset composition, human-rater protocol, error analysis, overrides, exceptions, claim register
Unit economics	API/model/OCR/storage cost, gross margin by product, support hours, CAC, sales cycle, receivable days
Technology & IP	Architecture, repositories, access control, IP assignments, third-party licenses, model/vendor terms, disaster recovery
Privacy & security	Data map, privacy notices, customer DPA, subprocessors, retention/deletion, vulnerability tests, incidents
Finance & tax	Monthly P&L, balance sheet, cash flow, bank statements, GST/TDS, budgets, liabilities, related-party transactions

Five facts to personalize before sending this plan

12. Founder names, roles, biographies, full-time status, and ownership.
13. Actual revenue/ARR, cash balance, monthly burn, liabilities, and prior funding.
14. Paying institutions, named pilots/LOIs, contract values, and qualified pipeline.

15.DASES pricing, cloud/model cost per sheet, gross margin, and faculty review effort.

16.Exact accuracy methodology and independent/customer validation evidence.

FUNDRAISING DISCIPLINE

Lead with evidence; negotiate dilution after the milestone story is credible.

A strong process creates leverage: clean data room, consistent metrics, multiple interested investors, a defined close date, and a clear view of the minimum capital needed to reach the next value inflection. Avoid presenting an unsupported valuation before the actual commercial evidence is assembled.

SECTION 15

Sources & Research Notes

Research cutoff: 31 July 2026

- [1] **DASES homepage.** Company-reported capabilities, performance, affiliations, and contact information. [Open source](#)

Notes on interpretation

- Company metrics and roadmap statements are not independently verified unless explicitly stated.
- Market sizing is a bottom-up scenario derived from official institution counts and illustrative annual contract values; it is not a market-research forecast.

- Financial projections, packaging, funding amount, and milestone targets are management recommendations created for planning and must be replaced or approved using actual company data.
- Competitive descriptions use public vendor materials and should be validated during commercial diligence.
- Privacy and fundraising references are strategic planning considerations, not legal, tax, accounting, or investment advice.

BIG CHALK BOX PVT. LTD.

bigchalkbox.com · dasesai.com
